#### 1. Definitions

- · Sample Space THE SET OF ALL POSSIBLE OUTCOMES (S)
- · Probability Model A DESCRIPTION OF SOME CHANCE PROCESS THAT CONSISTS OF 2 PARTS! SAMPLE SPACE + PROB. FOR FACH OUTCOME.
- · Event- ADY COLLECTION OF OUTCOMES FROM SOME CHANCE PROCESS. AN EVENT IS A SUBSET OF THE SAMPLE SPACE (CAPITAL LETTORS)
- Mutually Exclusive (DISJOIDT) EVENTS THAT CANDOT OCUR @ THE SAME TIME - THEY HAVE NO OUTCOMES IN COMMON

Example: 3 FLIPS OF A COIN

$$P(A) = \frac{4}{8} = \frac{1}{2}$$
  $P(B) = \frac{1}{8}$ 

### 2. Basic Rules of Probability

- The probability of any event is A NUMBER BETWEED O ADD I IDCLUSIVE. 0 4 P(x) 41
- All possible outcomes together must have PROBABILITIOS THAT SUM TO 1. 5 P(x)=1
- If all possible outcomes in a sample space are equally likely, the probability that event A occurs can be found using the formula

The probability that an eventdoes not occur is

ability that an eventdoes not occur is
$$P(NOTA) = 1 - P(A) A^{C}$$

$$NOTA \implies COMPLEMENT OF A$$

If two events have no outcomes in common, the probability that one or the other occurs is

# **Basic Probability Rules**

- For any event A,  $0 \le P(A) \le 1$
- If S is the sample space in a probability model, P(S)=1.
- In the case of equally likely outcomes,

 $P(A) = \frac{number\ of\ outcomes\ corresponding\ to\ event\ A}{total\ number\ of\ outcomes\ in\ the\ sample\ space}$ 

- Complement rule:  $P(A^c) = 1 P(A)$
- Addition rule for mutually exclusive events: If A and B are mutually exclusive,

$$P(A \text{ or } B) = P(A) + P(B)$$

**Example** - Randomly select a student who took the 2013 AP Statistics exam and record the student's score. Here is the probability model:

 Score
 1
 2
 3
 4
 5

 Probability
 0.233
 0.183
 0.235
 0.224
 0.125

(a) Show that this is a legitimate probability model.

(1) DEP(X;) = IV 3 .. LEGITIMATE MODEL.

(b) Find the probability that the chosen student scored 3 or better.

P(302 BETTON2) = P(3024 OR 5) = P(3) + P(4) + P(5) = 0.235 + 0.224 + 0.125 = 0.584 02.

& COMP. RULE: 1-P(1022)=1-(0.233+0.183)= 0.584

# CHECKYOUR UNDERSTANDING

Choose an American adult at random. Define two svents:

- A = the person has a cholesterol level of 240 milligrams per deciliter of blood (me/dl) or above (high cholesterol)
- B = the person has a cholesterol level of 200 to 239 mg/dl (borderline high cholesterol)

According to the American Heart Association, P(A) = 0.16 and P(B) = 0.29,

- 1. Explain why events A and B are mutually exclusive.
- 2. Say in plain language what the event "A or B" is. What is P(A or B)?
- 3. If C is the event that the person chosen has normal cholesterol (below 200 mg/dl), what's P(C)?

(1) PORSON CANDOT BE IN BOTH CHOL. ZONES () SAME TIME.

E PORSON FITHER HAS LEVEL OF 240 OR ABOVE OR LEVEL BETWEEN 200 AND 239.

P(A 02 B) = 0.16 + 0.29 = \0.45

(3) P(C)=1-P(AORB)= 1-0.45 2 [0.55]

# 3. Two-Way Tables and Probability

When we are trying to find probabilities involving two events, a two-way table can display the sample space in a way that makes probability calculations easy.

**Example** - What is the relationship between educational achievement and home ownership? A random sample of 500 people who participated in the 2000 census was chosen. Each member of the sample was identified as a high school graduate (or not) and as a homeowner (or not). The two-way table displays the data.

	High School Grad	Not a HS Grad	Total	
Homeowner	(221)	119	340	
Not a homeowner	89	71	160	
Total	310	190	500	

Suppose we choose a member of the sample at random. Find the probability that the member

(a) is a high school graduate.

500

(b) is a high school graduate and owns a home

221

(c) is a high school graduate or owns a home.

on  $1 - \frac{71}{500} =$ 

General Addition Rule for Two Events

If A and B are any two events resulting from some chance process, then

$$P(A \text{ or } B) = P(A) + P(B) - P(A \text{ and } B)$$

LIOTATION

0n = U

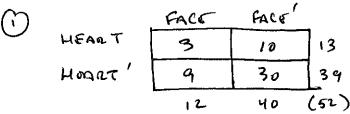

ALD = (

CHECK YOUR UNDERSTANDING

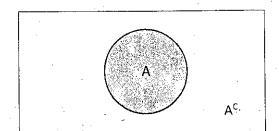

A standard deck of playing eards (with jokers removed) consists of 52 cards in four suits—clubs, diamonds, hearts, and spades. Each suit has 13 cards, with denominations ace, 2, 3, 4, 5, 6, 7, 8, 9, 10, jack, queen, and king. The jack, queen, and king are referred to as "face cards." Imagine that we shuffle the deck thoroughly and deal one card. Let's define events A: getting a face card and B: getting a heart.

(FORMULA SUEFT

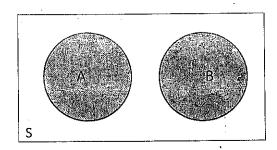

- 1. Make a two-way table that displays the sample space.
- 2. Find P(A and B).
- 3. Explain why  $F(A \text{ or } B) \neq F(A) + F(B)$ . Then use the general addition rule to find F(A or B).

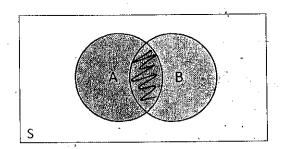

# 4. Venn Diagrams and Probability

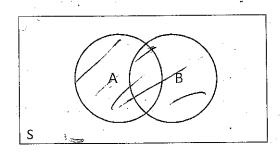

COMPLEMENTARY EVONTS P(A) + P(Ac) = 1

MUTUALLY EXCLUSIVE
EVENTS (NO OVORLAP)  $P(A \cap B) = O$   $P(A \cup B) = P(A) + P(B)$ 

P(AAB) = AREA OF OVORLAP.

**Examples** – pp. 312-13

P(AUB) = TOTAL AZEA.

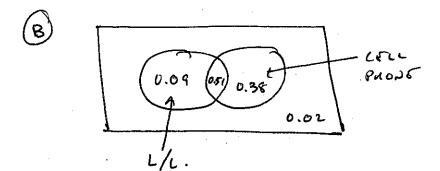

(DO DOT CONNT OVELLAP TUICE)

P(AUB) = P(A) + P(B) 
P(ANB)

P(ANB) = ARSA OF OVERLAP. **Application:** According to the National Center for Health Statistics, in December 2012, 60% of US households had a traditional landline telephone, 89% of households had cell phones, and 51% had both. Suppose we randomly selected a US household in December 2012.

- a. Make a two-way table that displays the sample space of this chance process.
- b. Construct a Venn diagram to represent the outcomes of this chance process.
- c. Find the probability that the household has at least two types of phones.
- d. Find the probability that the household has a cell phone only.

(A)		CELL	CELL,	TOTAL	
	LL	0.51	0.09	0.60	
	LL '	0.38	0.02	040	
÷	TOTAL	0-89	0.11	1.00	

- (C) P(AT LONGT ODE) = P(LL U CELL) =

  P(LL) + P(CELL) P(BOTH) = 0.60 + 0.89 0.51 = [0.98]

  THERE IS A 0.89 PROB. THAT THE HOUSEHOLD HAS

  AT LEAST ONE OF THE 2 TYPES OF PHODES.
- P(CELL ONLY) = P(LL' M CELL) = 0.38

  THORE IS 0.38 PROB\_ THAT THE HOUSEHOLD HAS
  ONLY A CELL PLONE.
